

LeafyHome India: Premium Plant Nutrition Matrix

Proper fertilization during the active growing season ensures lush foliage. Do not fertilize indoor plants during peak winter (December to January) as it causes chemical root burn.

Plant Common Name	Recommended Fertilizer Type	Dosage & Preparation	Application Frequency
Snake Plant	Balanced NPK 10-10-10 or Seaweed Extract	Liquid concentrate diluted to half-strength (2ml per liter of water)	Once every 45 days in Spring and Summer only
ZZ Plant	Slow-Release Granules or Vermicompost	2 tablespoons of organic vermicompost raked into topsoil	Once every 60 days from March to September
Pothos (Money Plant)	High Nitrogen NPK 19-19-19	Foliar spray solution (1 gram diluted in 2 liters of water)	Spray leaves once every 30 days during monsoons

Safety Note: Always water the soil thoroughly before applying chemical fertilizers. Applying nutrients to completely dry soil will permanently scorch the root system.
