

# LeafyHome Diagnostic Sheet: Soil Chemistry and Symptoms

## **Problem: Yellowing leaves on a ZZ plant.**

**Cause:** This is almost universally a sign of overwatering or poor soil drainage. When soil remains waterlogged, roots suffocate from a lack of oxygen, causing the cell walls in the leaves to collapse and turn yellow.

**Remedy:** Immediately cease watering. Slip the plant out of its pot to inspect for black, mushy roots. Prune damaged roots and repot in a fresh mix of 50% garden soil, 30% perlite, and 20% sand.

## **Problem: Brown, crispy leaf tips on a Money Plant.**

**Cause:** Low ambient humidity combined with direct exposure to dry indoor air-conditioning currents. It can also indicate fluoride/chlorine buildup from using raw Indian municipal tap water.

**Remedy:** Mist the foliage twice a week with distilled or filtered water. Move the plant away from AC vents and ceiling fans.
