

LEAFYHOME INTERNAL CLIENT PROTOCOL: WATERING REGIMENS FOR URBAN INDIA

A plant's water requirement changes drastically depending on the Indian geographic seasons: Summer (March to June), Monsoon (July to September), and Winter (October to February).

[SECTION: SNAKE PLANT WATERING]

During intense Indian summer months, water your Snake Plant once every 10 to 14 days. Ensure the top 2 inches of soil are bone-dry before rewatering. Conversely, during the high-humidity monsoon season, atmospheric moisture stays trapped in the soil; cut watering back to once every 21 days. In winter, when the plant enters dormancy, water sparingly only once every 30 to 45 days. Overwatering in winter triggers root rot within 72 hours.

[SECTION: ZZ PLANT WATERING]

The ZZ plant is highly drought-tolerant. In summer, water thoroughly once every 14 to 18 days, allowing excess water to completely drain out of the bottom hole. Never let the pot sit in standing water. During monsoons, increase the gap to 25 days. In the winter season, a single light watering every 35 to 40 days is sufficient to keep the rhizomes plump. Shriveled stems are a direct symptom of severe dehydration.
